Designs Department Manufacturing Information

No. 5.402(81)

Switched Mode Power Supplier PS4/8 and 8A

1. DESCRIPTION

This is an industry standard switched mode power supplier fitted with a front termination panel. Two different makes of power supplier are catered for: Gould (PS4/8) and Farnell (PS4/8A). Although they are 'standard' there are some mechanical differences and they are entirely different electrically. This Production Test Schedule does not deal with faults inside the main body of the power supplier, as faulty units should normally be returned to the manufacturer.

The termination panel provides four floating outputs wired in parallel, an LED to indicate the presence of the 28 volt output and a flying lead for mains input. A mains fuse is fitted on the power supplier and it may be changed by first removing the top cover immediately behind the front termination panel. The mains plug should also be fitted with a 5 amp fuse.

2. INFORMATION

- 2.1 Designed in RF Section (5), Designs Department
- 2.2 Designer and engineer responsible: M.T. Ellen
- 2.3 Handbook: part of DD Handbook No. 5.156(81)
- 2.4 No technical instruction available 1.4.81
- 2.5 Pre-production batch of 2 tested in Designs Department

3. MANUFACTURING PERFORMANCE SPECIFICATION

3.1 Input Requirements

Mains input (PLR)

170 to 265V ac

3.2 Output Requirements

Four parallel outputs (SKS)

28 ±0.05V dc with 5A load.

3.3 Performance

Regulation

Output should stay within ±0.05V for a load change of 0 to 5A and an input voltage range of 170 to 265V.

DDMI No. 5.402(81) Sheet 1 of 4 sheets Noise

Mains Ripple Switching Spikes <20mV p-p
<50mV p-p (The method of
measurement has a
significant effect on the
noise level indicated, see
section 7.5 for details).</pre>

Current Limit

9 ±0.5A on short circuit.

4. WARNING

This unit contains voltages above 200V ac and dc.

The power supplier operates by rectifying the incoming mains, which is then chopped at about 30kHz and passed through an isolating step down transformer. So a large proportion of the circuit is at high voltage and not isolated from the mains input.

This Production Test Schedule does not call for the covers to be removed (apart from the top of the termination panel), so the main danger during testing is that something could fall through the perforated cover. Care should also be taken with the mains termination block, which only has a plastic cover.

5. TEST EQUIPMENT REQUIRED

Variac, 240V input and 170 to 265V output.

AVO

DVM, 0.05% accuracy.

Load resistor, 5.6Ω, 150 watts.

Oscilloscope, 50MHz bandwidth.

Test lead fitted with XLR-3 and BNC plugs.

6. INSPECTION CHECKS

- 6.1 Inspect the unit for any mechanical defects. Check that it has been manufactured correctly to D 49977 Al.
- 6.2 Inspect the unit for any wiring defects, in particular earth wiring. Check that it has been wired correctly to D 49974 Al and D 49976 Al.
- 6.3 Check that a 5A fuse has been fitted in the mains plug.
- 6.4 Check that there are no defects that could make the unit unsafe, such as live conductors almost touching the top or bottom covers.

DDMI No. 5.402(81) Sheet 2 of 4 sheets

This drawing/specification is the property of the British Broadcasting Corporation and may not be reproduced or disclosed to a third party in any form without the written permission of the Corporation.

7. TEST PROCEDURE

7.1 To set the output voltage

- 7.1.1 Connect PLR to a Variac set to 240 ± 5 volts. Connect 1SKS to a 5.6 Ω load resistor (140 watts) and connect 2SKS to a DVM. Adjust the potentiometer on the internal front panel to set the voltage.
- 7.1.2 Set to 28 ±0.05 volts.
- 7.1.3 If this voltage cannot be obtained check the wiring and fuses. If no fault is found return the unit to the manufacturer, after first removing the termination panel.

7.2 To check regulation

- 7.2.1 Adjust the Variac over the range 170 to 265 volts, with and without the load resistor connected and measure the output voltage.
- 7.2.2 Check that the voltage does not change by more than $100\,\mathrm{mV}$.
- 7.2.3 If the regulation does not meet this specification check for loose or dry joints.

7.3 To check short circuit current

- 7.3.1 Connect an AVO (set to the 10A range) to 3SKS and measure the current, with the input set to 240 ±5V.
- 7.3.2 Short circuit current should be 9 ±0.5A and the output voltage should return to normal when the short is removed.

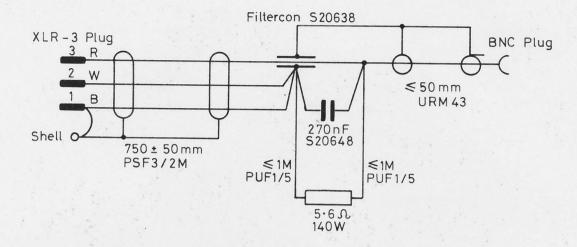

7.4 To check output isolation

- 7.4.1 With PLR connected directly to the mains and 1SKS connected to a 5.6Ω load resistor measure the resistance between mains earth and 3SKS pin 1, then between mains earth and 3SKS pin 2.
- 7.4.2 The results should be 0.1Ω and $10M\Omega$ respectively.
- 7.4.3 If the first result is wrong there is a wiring error, but if the second result is wrong there may be a wiring error or a faulty internal component.

7.5 To check noise output

7.5.1 The result of this measurement is critically dependent on the method used, so it is improtant that the test lead shown below should be used. This lead simulates the power supply lead in the transposer TM4M/503.

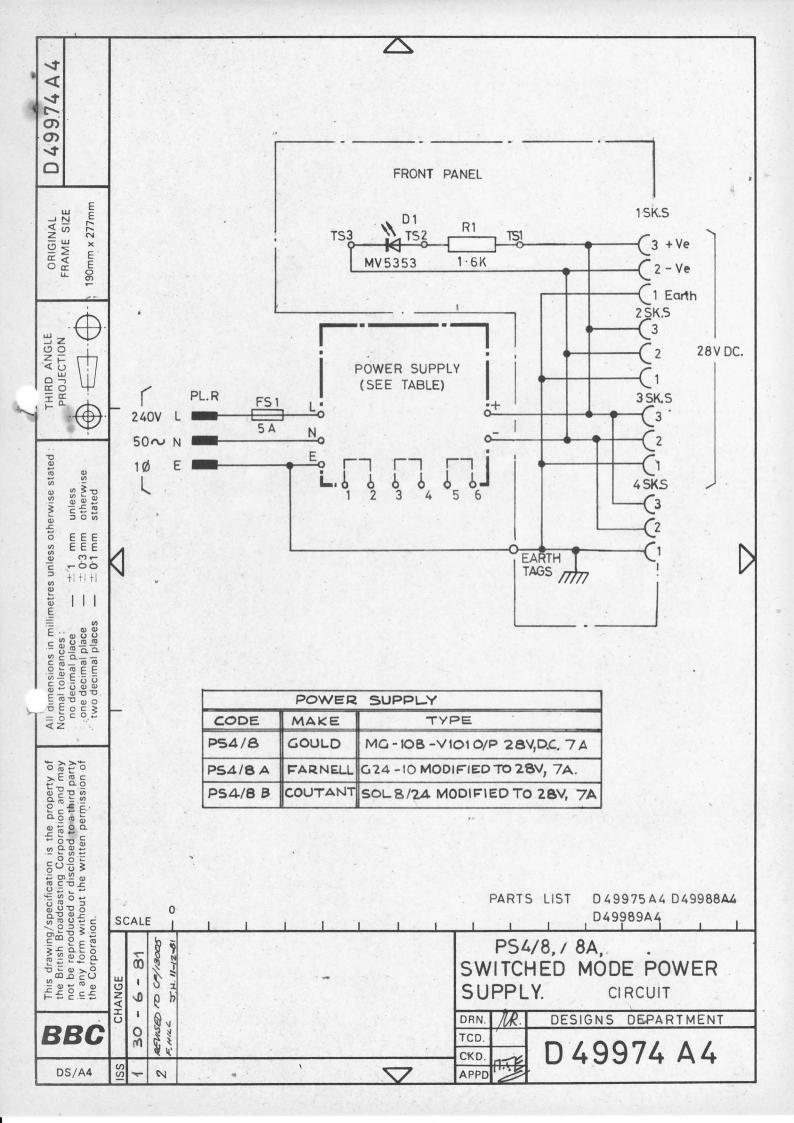

DDMI No. 5.402(81) Sheet 3 of 4 sheets 0

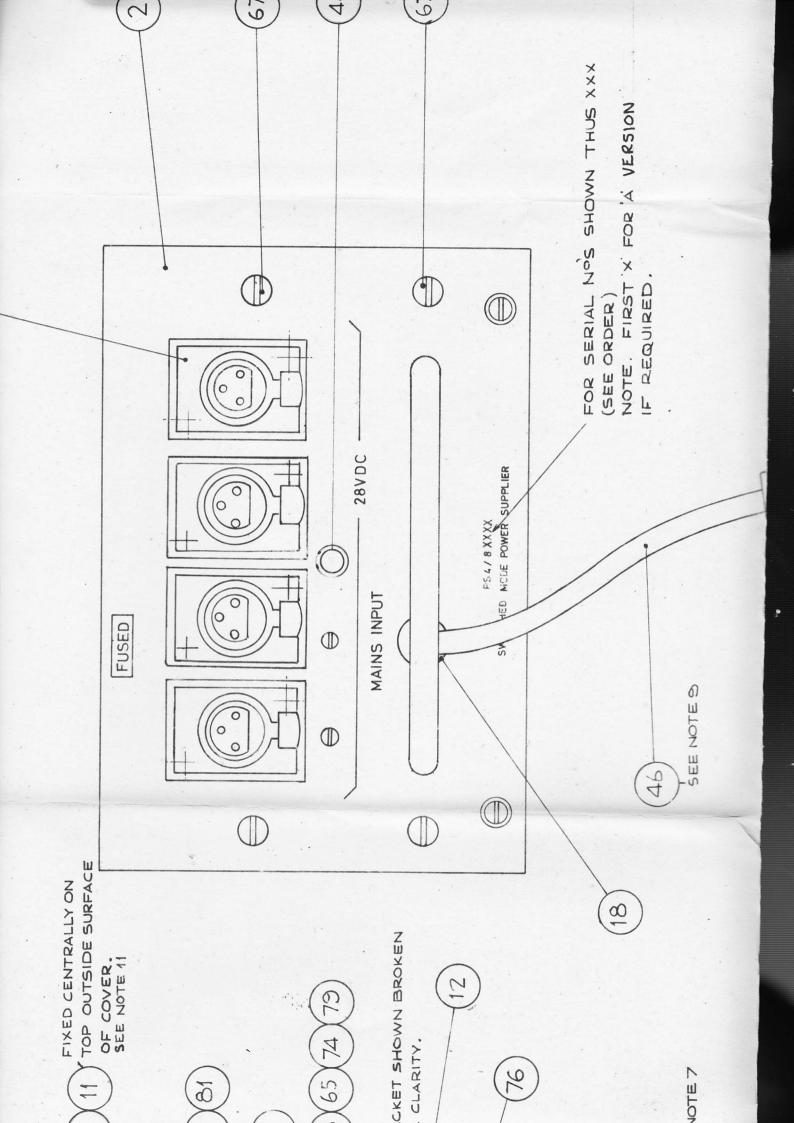

Connect the XLR-3 plug to 1SKS and the BNC plug to an ac coupled oscilloscope (B/W \geqslant 20MHz). Measure the peak to peak voltage of the hum component plus the switching frequency component. Note that the switching frequency is 30kHz approximately, but ringing at higher frequencies may also be present.

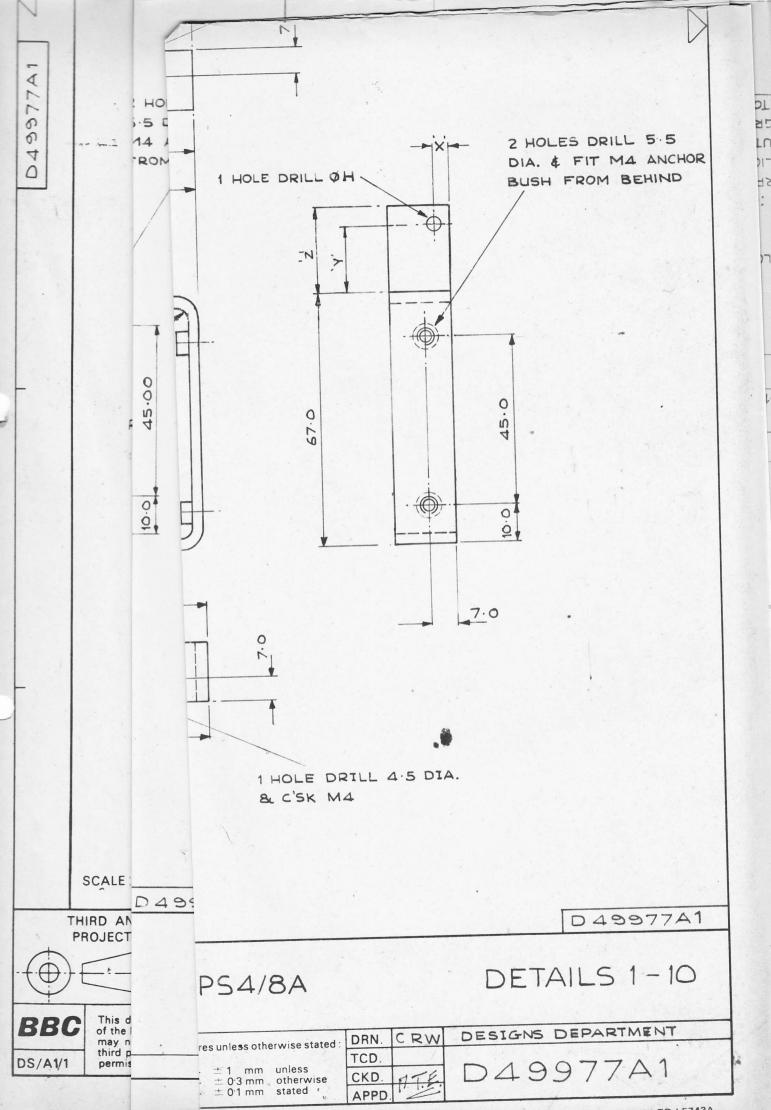

7.5.2 The peak to peak voltage should be less than 50mV.
