

TAPE LINKING CONSOLE DK1/4

The DK1/4 is similar to the DK1/3, but incorporates all the modifications stated in the Instruction on the DK1/3 to apply to only some, or later, machines.

The cabinet of the DK1/4 is about 30 mm deeper than that of the DK1/3, with a consequent slight increase in weight. In addition, on the DK1/4 the four tagstrips are physically much closer together, and are wired in the smaller MR 25 series resistors. This, with the increased cabinet depth, provides a space between

the rear of the rotary faders and their associated wiring harness, which facilitates access to the faders, and allows them to be removed for servicing without disturbing the wiring.

The two units, DK1/3 and DK1/4, are otherwise similar, and reference should be made to the Instruction on the DK1/3 for further details.
